Protein Sci. 13:2819-2824(2004).

-!- FUNCTION: Potently contract gastrointestinal (GI) smooth muscle. Induces proliferation, migration and fenestration (the formation of membrane discontinuities) in capillary endothelial cells derived from endocrine glands. Has little or no effect on a variety of other endothelial and non-endothelial cell types.
-!- SUBCELLUAR LOCATION: Secreted protein.
-!- TISSUE SPECIFICITY: Expressed in the steroidogenic glands, ovary, testis, adrenal and placents.
-!- SIMILARITY: Belongs to the prokinecitin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                              1 AVITGACERDVQCGAGTCCAISLWLRGLRMCTPLGREGEECHPGSHKVPFPRKRKHHTCP

                                                                                                                                                                                                                                                                                                                                                                                                - SUBCELLULAR LOCATION: Secreted protein (By similarity).
- SUBCELLULAR LOCATION: Expressed at high levels in testis and at lower levels in brain, lung, ovary, spleen, thymus and uterus.
- INDUCTION: Activated by CLOCK and BMAL1 heterodimers and light; inhibited by period genes (PER1, PER2 and PER3) and cryptochrome genes (CRY1 and CRY2) (Probable).
- SIMILARITY: Belongs to the prokinecitin family.
